Project Design Phase
Problem – Solution Fit Template

Date	03 October 2026
Team ID	
Project Name	Employee Data Import using Transform Maps (Spreadsheet) - ServiceNow
Maximum Marks	2 Marks

Problem – Solution Fit Template:

The Problem-Solution Fit simply means that you have found a problem with your customer and that the solution you have realized for it actually solves the customer's problem. It helps entrepreneurs, marketers and corporate innovators identify behavioral patterns and recognize what would work and why. Here, it checks that importing spreadsheet data with Transform Maps truly solves the administrator's problem of linking records to employees and securing them.

Purpose:

- Solve complex problems in a way that fits the state of your customers.
- Succeed faster and increase your solution adoption by tapping into existing mediums and channels of behavior.
- Sharpen your communication and marketing strategy with the right triggers and messaging.
- Increase touch-points with your company by finding the right problem-behavior fit and building trust by solving frequent annoyances, or urgent or costly problems.
- **Understand the existing situation in order to improve it for your target group.**

Template:

Define CS, fit into CC

1. CUSTOMER SEGMENT(S) — CS

Who is your customer? i.e. working parents of 0-5 y.o. kids

ServiceNow administrators and HR data owners who receive employee data as Excel / CSV sheets.

They maintain employee-linked records and need accurate details such as department for reporting.

6. CUSTOMER CONSTRAINTS — CC

What constraints prevent your customers from taking action or limit their choices of solutions?

Limited time for manual entry and little or no coding skill.

Spreadsheets with inconsistent formats, blank rows and duplicate employees.

Data must stay secure, with only permitted roles seeing sensitive fields.

Work is done on a ServiceNow instance (PDI) with limited roles.

5. AVAILABLE SOLUTIONS — AS

Which solutions are available to the customers when they face the problem or need to get the job done? What pros & cons do these solutions have?

Manual record-by-record entry: simple, but slow and error-prone.

Copy-paste into list view: faster, but records are not linked to employees.

Custom scripts: powerful, but need coding and maintenance.

Explore AS, differentiate

Focus on J&P, tap into BE, understand RC

2. JOBS-TO-BE-DONE / PROBLEMS — J&P

Which jobs-to-be-done (or problems) do you address for your customers? There could be more than one; explore different sides.

Import bulk employee data from a spreadsheet into ServiceNow.

Link each record to an employee and pull department details into the record.

Secure the data with ACLs and verify using Impersonate User.

9. PROBLEM ROOT CAUSE — RC

What is the real reason that this problem exists? What is the back story behind the need to do this job?

Data lives in spreadsheets with no field mapping to the Employee (sys_user) table.

No Coalesce rule, so re-imports create duplicates.

No ACLs are defined or tested, so records are open to unintended users.

7. BEHAVIOUR — BE

What does your customer do to address the problem and get the job done?

Admins type data by hand, search each employee separately and re-check rows.

They repeatedly ask HR for department details.

They test access by logging in as other users, or skip testing.

Focus on J&P, tap into BE, understand RC

Identify strong TR & EM

3. TRIGGERS — TR

What triggers customers to act? i.e. seeing their neighbour installing solar panels.

HR sends a new employee sheet.

Management asks for department-wise reports.

An audit asks who can see sensitive fields.

4. EMOTIONS: BEFORE / AFTER — EM

How do customers feel when they face a problem or a job and afterwards?

Before: frustrated, overwhelmed, worried about errors and data leaks.

After: confident, in control, relieved.

10. YOUR SOLUTION — SL

If you are working on an existing business, write down your current solution first, fill in the canvas, and check how much it fits reality.

Use Import Sets and Transform Maps:

1) Attach the spreadsheet to a Data Source and load it into a staging table.

2) Create a Transform Map; map Employee ID to the sys_user reference field and set Coalesce to avoid duplicates.

3) Use a field script to pull department into the record.

4) Run the transform and check Transform History.

5) Create ACLs and test them with Impersonate User.

8.1 ONLINE — CH

What kind of actions do customers take online? Extract online channels from #7.

ServiceNow web UI: Data Sources, Import Sets, Transform Maps.

Email or shared drive to receive files; ServiceNow documentation and community.

8.2 OFFLINE — CH

What kind of actions do customers take offline? Extract offline channels from #7 and use them for customer development.

Spreadsheets prepared offline in Excel.

Discussions with HR and the team to decide field mappings.

Extract online & offline CH of BE
