Project Development Phase
Model Performance Test

Date	03 October 2026
Team ID	
Project Name	Employee Data Import using Transform Maps (Spreadsheet) - ServiceNow
Maximum Marks	10 Marks

Model Performance Testing:

Project team shall fill the following information in model performance testing template. This project does not use a machine learning model, so regression metrics (MAE, MSE, RMSE, R2) are not applicable. The classification-style metrics are applied to the Transform Map import, treating each spreadsheet row as either valid or invalid and checking whether the import handled it correctly.

<table>
<tr><th>S.No.</th><th>Parameter</th><th>Values</th></tr>
<tr><td>1.</td><td>Metrics</td><td>Regression Model: Not applicable (no ML model is used).

Classification-style metrics for the import:

Total rows tested:
Confusion Matrix (TP = valid rows imported, FN = valid rows wrongly rejected, FP = invalid rows wrongly imported, TN = invalid rows correctly rejected):
<table>
<tr><th></th><th>Imported (inserted / updated)</th><th>Rejected (ignored / error)</th></tr>
<tr><td>Valid row</td><td>TP =</td><td>FN =</td></tr>
<tr><td>Invalid row</td><td>FP =</td><td>TN =</td></tr>
</table>
Accuracy Score = (TP + TN) / total rows:
Precision = TP / (TP + FP):
Recall = TP / (TP + FN):
Classification Report (summary of the above, plus Employee Link and Department correctness):</td></tr>
<tr><td>2.</td><td>Tune the Model</td><td>Configuration Tuning (the equivalent of hyperparameter tuning): changes made to improve results, for example corrected Field Maps, Coalesce on Employee ID, date format fix, field script for department, file split into batches:

Import accuracy after tuning (%):

Validation Method: compare the spreadsheet row count with the Import Set rows and target records; review Transform History (inserted / updated / ignored counts) and the Import Log; verify employee and department values on sample records; confirm access using Impersonate User.</td></tr>
</table>
